EDUCATION

Georgia Institute of Technology

May 2027

Bachelor of Science in **Computational Media (Computer Science + Interaction Design)** | Minor in **Business Administration**

- Relevant Coursework: Data Structures, Software Development, Theory of Computing, Systems Programming (C/Linux), Intro to Computing & Programming, Discrete Math, Applied Linear Algebra, Multivariable Calculus, Differential & Integral Calculus

Certifications & Awards:

- Women in Technology (WIT) Girl of the Year Finalist — Selected as 1 of 3 finalists from a global network of 48,000+ women.
- GIAC Foundational Cybersecurity Technologies (GFACT) — August 2023 (Expires: August 2027)
- SANS SEC275: Computers, Technology, & Security — August 2023
- IT Specialist - Java (Certiport) — April 2024
- IT Specialist - Software Development (Certiport) — April 2024

SKILLS

Product: Agile (Scrum), backlog prioritization, user stories, acceptance criteria, technical documentation, cross-functional collaboration

Languages: Python, Java, C, JavaScript, MATLAB

Data: NumPy, Pandas, Matplotlib, data cleaning, normalization, ETL workflows, time-series transforms, missing-data handling

Cloud/DevOps: AWS (Lambda, API Gateway, DynamoDB, IAM, CloudWatch, SNS/SQS), Docker, Terraform, GitHub Actions

Databases: SQLite, MySQL, DynamoDB, FAISS, Pinecone

Frameworks/Tools: Git, Apache Kafka, Linux, Jenkins, JavaFX, Node.js, React, D3.js, Three.js

PROJECTS

CourseHawk (UGA KTP Course Scheduler) — Product Manager

September 2025 - December 2025

- Owned product design and delivery for CourseHawk, leading a team of 6 engineers and designers through a full Agile build cycle.
- Designed product workflows and feature scope, incorporating engineer input to account for technical constraints and implementation tradeoffs.
- Translated user needs into concrete system requirements, edge cases, and a prioritized backlog that engineers could implement directly.
- Collaborated with engineers to evaluate data models, API boundaries, and feature complexity before committing to scope.
- Ran sprint planning, standups, backlog grooming, and retrospectives, maintaining momentum and resolving cross-functional blockers.
- Reviewed feature implementations against product requirements to ensure correctness, usability, and alignment with original design intent.
- Shipped a functional MVP and iterated based on internal user testing and observed failure modes.

KTPHacks 2025 (1st Place) - Eyewitness

November 2025

- Architected “Eyewitness,” an AI full-stack computer-vision application for real-time eye and head movement tracking and attention visualization.
- Designed a Python backend using MediaPipe Face Mesh and EyeTrax to extract 3D eye-landmark data, compute gaze vectors at 30 FPS, and stream them through a processing layer built with OpenCV and NumPy for smoothing, blink detection, and noise filtering.
- Integrated Hugging Face API and Claude API to generate attention-region summaries and descriptive scene annotations from gaze trajectories.
- Developed a real-time heatmap renderer in Python that converts gaze coordinates into pixel-intensity grids, applies Gaussian blur to visualize fixation density, and alpha-blends overlays on video frames.
- Implemented an interactive Next.js + Framer Motion frontend to visualize gaze analytics.

Healthcare Accessibility Application

March 2025

- Built a full-stack JavaFX application to automate healthcare cost analysis and provider discovery.
- Integrated an AI-assisted data preprocessing pipeline using Hugging Face transformer models and scikit-learn feature transformers to classify malformed API responses, infer missing provider attributes, and normalize structured fields before visualization.
- Added a high-throughput REST API layer with schema normalization and request batching to support 500+ unique user queries in real time.
- Reduced provider search time by ~40% with multithreaded request handling and adaptive throttling.

EXPERIENCE

Cox Automotive

Atlanta, GA

Software Engineering Intern

May 2025 - August 2025

- Designed and productionized SkeyLift, a Slack-based platform for secure automated API key provisioning, deployed as an event-driven AWS Lambda system behind API Gateway. Actively used by 12+ internal engineering teams, reducing API key delivery time from hours to seconds.
- Worked directly with internal platform users to clarify requirements, define failure cases, and set system guarantees before implementation.
- Built key lifecycle storage using DynamoDB with TTLs, IAM-restricted access, and CloudWatch logs, modeling items to expose key expiry, requester identity, hashed key material, and provisioning metadata so engineers could reliably audit and debug key lifecycle events.
- Integrated Docker-based Lambda container builds to ensure production parity and leveraged enterprise AI-native development workflows using MCP (Model Context Protocol) to architect an event-driven serverless system.
- Contributed to team deliverables beyond intern project, shipping features, bug fixes, and CI/CD improvements in a large enterprise monorepo.
- **Tech Stack:** *Python, AWS (Lambda, API Gateway, DynamoDB, S3), Terraform, Docker, Git, GitHub Actions, Slack Bolt API*

Developmental Dynamics Lab UGA

Athens, GA

Data Visualization Researcher

August 2024 - Present

- Engineered a Java-based desktop application with optional web interface for real-time multimodal data visualization synchronized with video footage, improving processing efficiency by 80 percent
- Worked directly with researchers to identify pain points in existing analysis workflows and define system requirements.
- Built AI-powered data preprocessing pipelines using Python, MATLAB, and scikit-learn to smooth physiological signals and reduce sensor noise.
- Designed a scalable backend using Kafka for event streaming, Hibernate for persistence, and SQLite for offline access.
- Engineered visual components in React/D3.js, optimizing SVG/Canvas rendering and interaction logic for large multimodal datasets.
- **Tech Stack:** *Java, Python, scikit-learn, MATLAB, Hibernate, Apache Kafka, SQLite, JUnit, Mockito, Jenkins, TLS 1.3, AES-256*
